Lcd panel features

(i) | NOTE: The LCD panel is not supported in the 10-hard drive system.

The system's LCD panel provides system information and status and error messages to indicate when the system is operating correctly or when the system needs attention. See LCD Error Messages for information about specific error codes.

- The LCD backlight lights blue during normal operating conditions and lights amber to indicate an error condition.
- The LCD backlight is off when the system is in standby mode and can be turned on by pressing either the Select, Left, or Right button on the LCD panel.
- The LCD backlight remains off if LCD messaging is turned off through the iDRAC utility, the LCD panel, or other tools.

Configuring iDRAC from the LCD panel

The LCD panel on the front bezel (optional) has these three buttons for selecting, changing, and entering data:

- **✓** = Enter
- **<** = Move the selection to the left or decrease the value (depending on the context)
- **>** = Move the selection to the right or increase the value (depending on the context)

We can assign iDRAC IP address by using LifeCycle controller, BIOS, and from the LCD panel.

NOTE: Changing iDRAC IP from the LCD panel will only be available on system with optional front bezel with LCD panel.

- 1 Press **✓** to enter the system menu.
- 2 Press **>** to select **Setup** and then press **✓**.
- 3 Select **iDRAC**, and press **✓**.
- 4 Press **>** to select **StaticIP** and press **✓**.

NOTE: The LCD panel might display a default IP address. You need to change the numbers that differ from the static IP address you want to assign.

- 5 Press **>** until you have selected a number that you want to change and then press **✓** to set the number.
- 6 Press **>** to increase the value or **<** to decrease the value. When the correct number is displayed, press **✓**.
- 7 Repeat steps 5 and 6 for each additional number you need to change.
- 8 When the static IP address is correct, press **>** until **»** is selected, and then press **✓**.
- 9 The LCD shows the default subnet mask (Sub). Use the instructions in steps 5 and 6 to modify values as needed.
- 10 Press **>** until **»** is selected, and then press **✓**.
- 11 The LCD shows the default gateway IP address. Use the instructions in steps 5 and 6 to modify values as needed.

- 12 Press **>** until **»** is selected, and then press **✓**.
- 13 The LCD displays if you want to set up DNS. This is recommended, as setting up DNS enables you to program network resources on the iDRAC based on DNS names, rather than requiring you to enter IP addresses.
 - a If you do not want to set up DNS, select **No** and press **✓**. Then select **Save** and press **✓**, configuration is complete.
 - b To set up DNS, select **Yes**, press **✓**, and continue to the next step.
- 14 The default DNS address (D1) is displayed on the LCD panel. Use the instructions in steps 5 and 6 to modify values as required.
- 15 The LCD panel displays the default address for an alternate DNS server (D2). An alternate server is optional, however provides redundancy in case the primary DNS server fails. Use the instructions in steps 5 and 6 to modify values as required. If you do not want to configure an alternate server, set all values to zeros.
- 16 When prompted to save, select **Yes** and press **✓**.

 **NOTE:** **Settings are not applied until you press Yes to save. Also the display eventually times out and all unsaved configuration changes are lost.**

Diagnostic indicators

The diagnostic indicators on the system front panel display error status during system startup.

 **NOTE:** **The diagnostic indicators are not present if the system is equipped with an LCD display.**

 **NOTE:** **The diagnostic indicators are present only on the 10-hard drive system.**

The following section describes system conditions and possible corrective actions associated with these indicators:

Electrical indicator

Condition	Corrective Action
The indicator blinks amber if the system experiences an electrical error (for example, voltage out of range, or a failed power supply or voltage regulator).	See the System Event Log or system messages for the specific issue. If it is due to a problem with the power supply, check the LED on the power supply. Re-seat the power supply by removing and reinstalling it. If the problem persists, see Getting Help .

Temperature indicator

Condition	Corrective Action
The indicator blinks amber if the system experiences a thermal error (for example, a temperature out of range or fan failure).	Ensure that none of the following conditions exist: <ul style="list-style-type: none"> • A cooling fan is removed or has failed. • System cover, cooling shroud, EMI filler panel, memory-module blank, or back-filler bracket is removed. • Ambient temperature is too high. • External airflow is obstructed.

See [Getting Help](#).

Memory indicator

Condition	Corrective Action
The indicator blinks amber if a memory error occurs.	See the system event log or system messages for the location of the failed memory. Reinstall the memory device. If the problem persists, see Getting Help .

Hard-Drive indicator patterns

Figure 4. Hard-Drive Indicators

1 hard-drive activity indicator (green) 2 hard-drive status indicator (green and amber)

Indicator	Indicator code
Link and activity indicators are off	The NIC is not connected to the network.

Activity indicator is blinking green	Network data is being sent or received.

Power Indicator Codes

Each AC power supply has an illuminated translucent handle and each DC power supply (when available) has an LED that serves as an indicator to show whether power is present or whether a power fault has occurred.

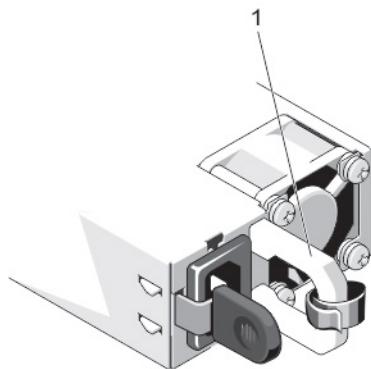

Figure 8. AC Power Supply Status Indicator

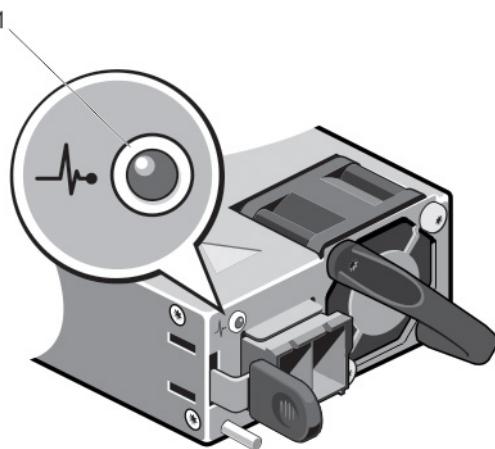

Figure 9. DC Power Supply Status Indicator

Power Indicator Pattern	Condition
-------------------------	-----------

Not lit Power is not connected.

Green The handle/LED indicator lights green indicating that a valid power source is connected to the power supply and that the power supply is operational.

Flashing amber Indicates a problem with the power supply.

CAUTION: When correcting a power supply mismatch, replace only the power supply with the flashing indicator. Swapping the opposite power supply to make a matched pair can result in an error condition and unexpected system shutdown. To change from a High Output configuration to a Low Output configuration or vice versa, you must power down the system.

CAUTION: AC power supplies support both 220 V and 110 V input voltages with the exception of Titanium power supplies, which support only 220 V. When two identical power supplies receive different input voltages, they can output different wattages, and trigger a mismatch.

CAUTION: If two power supplies are used, they must be of the same type and have the same maximum output power.

Power Indicator Pattern	Condition
	⚠ CAUTION: Combining AC and DC power supplies is not supported and triggers a mismatch.
Flashing green	When hot-adding a power supply, this indicates that the power supply is mismatched with the other power supply (in terms of efficiency, feature set, health status, and supported voltage). Replace the power supply that has the flashing indicator with a power supply that matches the capacity of the other installed power supply.

Using the system setup and boot manager

System Setup enables you to manage your system hardware and specify BIOS-level options.

The following keystrokes provide access to system features during startup:

Table 1. System setup keystrokes

Keystroke	Description
<F2>	Opens the System Setup page.
<F10>	Opens and starts Lifecycle Controller, which supports systems management features such as operating system deployment, hardware diagnostics, firmware updates, and platform configuration, using a GUI. The feature set available in Lifecycle Controller is determined by the iDRAC license installed.
<F11>	Opens the BIOS Boot Manager or the Unified Extensible Firmware Interface (UEFI) Boot Manager, depending on the boot configuration of the system.
<F12>	Starts Preboot Execution Environment (PXE) boot.

From System Setup, you can:

- Change the NVRAM settings after you add or remove hardware
- View the system hardware configuration
- Enable or disable integrated devices
- Set performance and power management thresholds
- Manage system security

You can access System Setup using the:

- Standard graphical browser, which is enabled by default
- Text browser, which is enabled using **Console Redirection**

To enable **Console Redirection**, in **System Setup**, select **System BIOS > Serial Communication screen > Serial Communication**, select **On with Console Redirection**.

(i) **NOTE:** By default, help text for the selected field is displayed in the graphical browser. To view the help text in the text browser, press <F1>.

Choosing the system boot mode

System Setup enables you to specify one of the following boot modes for installing your operating system:

- BIOS boot mode (the default) is the standard BIOS-level boot interface.
- Unified Extensible Firmware Interface (UEFI) (the default) boot mode is an enhanced 64-bit boot interface. If you have configured your system to boot to UEFI mode, it replaces the system BIOS.

- 1 From the **System Setup Main Menu**, click **Boot Settings**, and select **Boot Mode**.
- 2 Select the boot mode you want the system to boot into.

 **CAUTION:** Switching the boot mode may prevent the system from booting if the operating system is not installed in the same boot mode.

- 3 After the system boots in the specified boot mode, proceed to install your operating system from that mode.

 **NOTE:**

- Operating systems must be UEFI-compatible to be installed from the UEFI boot mode. DOS and 32-bit operating systems do not support UEFI and can only be installed from the BIOS boot mode.
- For the latest information about supported operating systems, go to Dell.com/ossupport.

Entering System Setup

- 1 Turn on, or restart your system.
- 2 Press F2 immediately after you see the following message:
`F2 = System Setup`

If your operating system begins to load before you press F2, wait for the system to finish booting, and then restart your system and try again.

Responding to error messages

If an error message is displayed while the system is booting, make a note of the message. For more information, see System Error Messages.

 **NOTE:** After installing a memory upgrade, it is normal for your system to display a message the first time you start your system.

Using the system setup navigation keys

Keys	Action
Up arrow	Moves to the previous field.
Down arrow	Moves to the next field.
<Enter>	Allows you to type in a value in the selected field (if applicable) or follow the link in the field.
Spacebar	Expands or collapses a drop-down menu, if applicable.
<Tab>	Moves to the next focus area.

Cooling shroud

The cooling shroud aerodynamically directs the airflow across the entire system. The airflow passes through all the critical parts of the system, where the vacuum pulls air across the entire surface area of the heat sink, thus allowing increased cooling.

Removing the cooling shroud

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

CAUTION: Never operate your system with the air shroud removed. The system may get overheated quickly, resulting in shutdown of the system and loss of data.

- 1 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet and peripherals.
- 2 Open the system.
- 3 Hold the touch points and lift the shroud away from the system.

NOTE: For proper seating of the cooling shroud in the chassis, ensure that the cables inside the system are routed along the chassis wall and secured using the cable securing bracket.

- 1 Align the tabs on the cooling shroud with the securing slots on the chassis.
- 2 Lower the cooling shroud into the chassis until it is firmly seated.
- 3 If applicable, replace the full-length PCIe card.
- 4 Close the system.
- 5 Reconnect the system to its electrical outlet and turn the system on, including any attached peripherals.

System memory

Your system supports DDR3 unbuffered ECC DIMMs (ECC UDIMMs), registered DIMMs (RDIMMs), and load reduced DIMMs (LRDIMMs). It supports DDR3 and DDR3L voltage specifications.

NOTE: MT/s indicates DIMM speed in MegaTransfers per second.

Memory bus operating frequency can be 1866 MT/s, 1600 MT/s, 1333 MT/s, 1066 MT/s, or 800 MT/s depending on:

- DIMM type (UDIMM, RDIMM, or LRDIMM)
- DIMM configuration (number of ranks)
- maximum frequency of the DIMMs
- number of DIMMs populated per channel
- DIMM operating voltage
- system profile selected (for example, Performance Optimized, Custom, or Dense Configuration Optimized)
- maximum supported DIMM frequency of the processors

The system contains 24 memory sockets split into two sets of 12 sockets, one set per processor. Each 12-socket set is organized into four channels. In each channel, the release levers of the first socket are marked white, the second socket black, and the third socket green.

NOTE: DIMMs in sockets A1 to A12 are assigned to processor 1 and DIMMs in sockets B1 to B12 are assigned to processor 2.

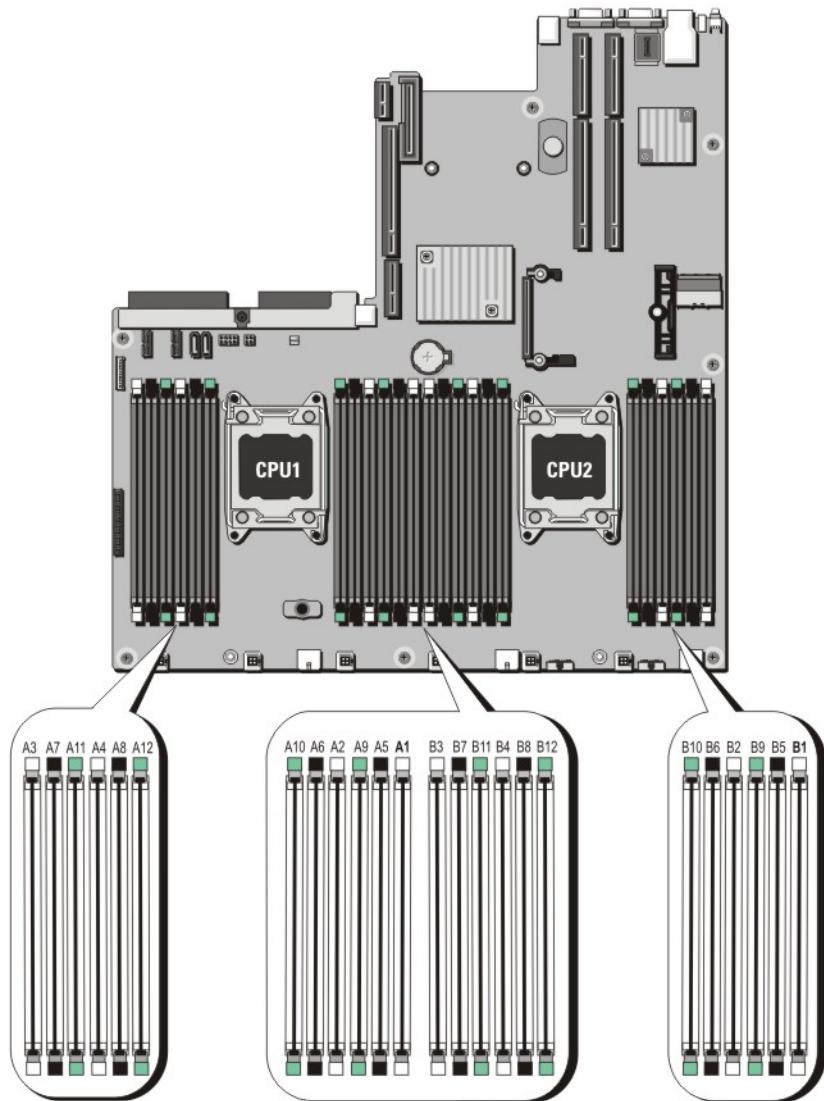

Figure 15. Memory socket locations

Memory channels are organized as follows:

Table 2. Memory channels

Processor	Channel 0	Channel 1	Channel 2	Channel 3

General Memory Module Installation Guidelines

This system supports Flexible Memory Configuration, enabling the system to be configured and run in any valid chipset architectural configuration. The following are the recommended guidelines for best performance:

- UDIMMs, RDIMMs, and LRDIMMs must not be mixed.
- x4 and x8 DRAM based DIMMs can be mixed. For more information, see Mode-Specific Guidelines.
- A maximum of two UDIMMs can be populated in a channel.
- Up to two quad-rank RDIMMs and up to three dual- or single-rank RDIMMs can be populated per channel. When a quad-rank RDIMM is populated in the first slot with white release levers, the third DIMM slot in the channel with green release levers cannot be populated.
- Up to three LRDIMMs can be populated regardless of rank count.
- Populate DIMM sockets only if a processor is installed. For single-processor systems, sockets A1 to A12 are available. For dual-processor systems, sockets A1 to A12 and sockets B1 to B12 are available.
- Populate all sockets with white release tabs first, then black, and then green.
- Do not populate the third DIMM socket in a channel with green release tabs, if a quad-rank RDIMM is populated in the first socket with white release tabs.
- Populate the sockets by highest rank count in the following order — first in sockets with white release levers, then black, and then green. For example, if you want to mix quad-rank and dual-rank DIMMs, populate quad-rank DIMMs in the sockets with white release tabs and dual-rank DIMMs in the sockets with black release tabs.
- In a dual-processor configuration, the memory configuration for each processor should be identical. For example, if you populate socket A1 for processor 1, then populate socket B1 for processor 2, and so on.
- Memory modules of different sizes can be mixed provided that other memory population rules are followed (for example, 2 GB and 4 GB memory modules can be mixed).
- Populate four DIMMs per processor (one DIMM per channel) at a time to maximize performance.
- If memory modules with different speeds are installed, they will operate at the speed of the slowest installed memory module(s) or slower depending on system DIMM configuration.

Mode-specific guidelines

Four memory channels are allocated to each processor. The possible configurations depend on the memory mode selected.

NOTE: x4 and x8 DRAM based DIMMs can be mixed providing support for RAS features. However, all guidelines for specific RAS features must be followed. x4 DRAM based DIMMs retain Single Device Data Correction (SDDC) in memory optimized (independent channel) mode. x8 DRAM based DIMMs require Advanced ECC mode to gain SDDC.

The following sections provide additional slot population guidelines for each mode.

Advanced Error Correction Code

Advanced Error Correction Code (ECC) mode extends SDDC from x4 DRAM based DIMMs to both x4 and x8 DRAMs. This protects against single DRAM chip failures during normal operation.

The installation guidelines for memory modules are as follows:

- Memory modules must be identical in size, speed, and technology.
- DIMMs installed in memory sockets with white release levers must be identical and the same rule applies for sockets with black release levers. This ensures that identical DIMMs are installed in matched pair —for example, A1 with A2, A3 with A4, A5 with A6, and so on.

Memory optimized independent channel mode

This mode supports Single Device Data Correction (SDDC) only for memory modules that use x4 device width. It does not impose any specific slot population requirements.

Memory sparing

NOTE: To use memory sparing, this feature must be enabled in System Setup.

In this mode, one rank per channel is reserved as a spare. If persistent correctable errors are detected on a rank, the data from this rank is copied to the spare rank, and the failed rank is disabled.

With memory sparing enabled, the system memory available to the operating system is reduced by one rank per channel. For example, in a dual-processor configuration with sixteen 4 GB single-rank memory modules, the available system memory is: $3/4$ (ranks/channel) \times 16 (memory modules) \times 4 GB = 48 GB, and not 16 (memory modules) \times 4 GB = 64 GB.

NOTE: Memory sparing does not offer protection against a multi-bit uncorrectable error.

NOTE: Both Advanced ECC/Lockstep and Optimizer modes support memory sparing.

Memory mirroring

Memory mirroring offers the strongest memory module reliability mode compared to all other modes, providing improved uncorrectable multi-bit failure protection. In a mirrored configuration, the total available system memory is one half of the total installed physical memory. Half of the installed memory is used to mirror the active memory modules. In the event of an uncorrectable error, the system switches over to the mirrored copy. This ensures SDDC and multi-bit protection.

The installation guidelines for memory modules are as follows:

- Memory modules must be identical in size, speed, and technology.

- Memory modules installed in memory module sockets with white release levers must be identical and the same rule applies for sockets with black and green release tabs. This ensures that identical memory modules are installed in matched pairs—for example, A1 with A2, A3 with A4, A5 with A6, and so on.

Removing memory modules

- ⚠️ WARNING:** The memory modules are hot to touch for some time after the system has been powered down. Allow the memory modules to cool before handling them. Handle the memory modules by the card edges and avoid touching the components or metallic contacts on the memory module.
- ⚠️ CAUTION:** Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.
- ⚠️ CAUTION:** To ensure proper cooling, memory module blanks must be installed in any memory socket that is not occupied. Remove memory module blanks only if you intend to install memory modules in those sockets.

- 1 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet and peripherals.
- 2 Open the system.
- 3 Remove the cooling shroud.
- 4 Locate the appropriate memory-module socket(s).
- 5 To release the memory-module blank from the socket, simultaneously press the ejectors on both ends of the memory module socket.

⚠️ CAUTION: Handle each memory module only by the card edges, making sure not to touch the middle of the memory module or metallic contacts. To avoid damaging the memory module, handle only one memory module at a time.

- 5 If a memory module or a memory-module blank is installed in the socket, remove it.

NOTE: Retain removed memory-module blank(s) for future use.

- 6 Align the memory-module's edge connector with the alignment key of the memory-module socket, and insert the memory module in the socket.

NOTE: The memory-module socket has an alignment key that allows you to install the memory module in the socket in only one orientation.

CAUTION: To prevent damage to the memory-module socket during installation, apply pressure at both ends of the memory module evenly. Do not apply pressure to the center of the memory module.

- 7 Press down on the memory module with your thumbs until the memory module snaps into place.

NOTE: When the memory module is properly seated in the socket, the levers on the memory-module socket align with the levers on the other identical sockets that have memory modules installed.

- 8 Repeat step 4 through step 7 of this procedure to install the remaining memory modules.
- 9 Replace the cooling shroud.
- 10 Close the system.
- 11 Reconnect the system to its electrical outlet and turn on the system, including any attached peripherals.
- 12 Press <F2> to enter the System Setup, and check the memory settings.
The system should have already changed the value to reflect the newly installed memory.
- 13 If the value is incorrect, one or more of the memory modules may not be installed properly. Repeat step 4 through step 7 of this procedure, checking to ensure that the memory modules are firmly seated in their sockets.
- 14 Run the appropriate diagnostic test. For more information, see Using System Diagnostics.

Hard drives

All hard drives connect to the system board through the hard drive backplane. Hard drives are supplied in hot swappable hard drive carriers that fit in the hard drive slots.

CAUTION: Before attempting to remove or install a hard drive while the system is running, see the documentation for the storage controller card to ensure that the host adapter is configured correctly to support hot swappable hard drive removal and insertion.

CAUTION: Do not turn off or reboot your system while the hard drive is being formatted. Doing so can cause a hard drive failure.

NOTE: Use only hard drives that have been tested and approved for use with the hard drive backplane.

When you format a hard drive, allow enough time for the formatting to be completed. High-capacity hard drives can take several hours to format.

Removing a 2.5 inch hard drive blank

 CAUTION: To maintain proper system cooling, all empty hard drive slots must have hard drive blanks installed.

- 1 If installed, remove the front bezel.
 - 2 Press the release button and slide the hard drive blank out until it is free of the hard drive slot.

 - 3 If applicable, install the front bezel.

Removing a hot-swap hard drive

CAUTION: To prevent data loss, ensure that your operating system supports hot-swap drive installation. See the documentation supplied with your operating system.

- 1 From the management software, prepare the hard drive for removal. Wait until the indicators on the hard-drive carrier signal that the hard drive can be removed safely. For more information, see the documentation for the storage controller.
If the hard drive is online, the green activity/fault indicator flashes as the drive is turned off. When the hard-drive indicators are off, the hard drive is ready for removal.
 - 2 Press the release button to open the hard-drive carrier release handle.
 - 3 Slide the hard-drive carrier out until it is free of the hard-drive slot.

 CAUTION: To maintain proper system cooling, all empty hard-drive slots must have hard-drive blanks installed.

- 4 Insert a hard-drive blank in the empty hard-drive slot.

Installing a hot swappable hard drive or solid state drive

- ⚠ | CAUTION: Use only hard drives that have been tested and approved for use with the hard drive backplane.
- ⚠ | CAUTION: When installing a hard drive, ensure that the adjacent drives are fully installed. Inserting a hard drive carrier and attempting to lock its handle next to a partially installed carrier can damage the partially installed carrier's shield spring and make it unusable.
- ⚠ | CAUTION: Combining SAS and SATA hard drives in the same RAID volume is not supported.
- ⚠ | CAUTION: To prevent data loss, ensure that your operating system supports hot-swap drive installation. See the documentation supplied with your operating system.
- ⚠ | CAUTION: When a replacement hot swappable drive is installed and the system is powered on, the drive automatically begins to rebuild. Ensure that the replacement drive is blank or contains data that you wish to overwrite. Any data on the replacement drive is immediately lost after the drive is installed.

- 1 If a hard drive blank is installed in the hard drive slot, remove it.
- 2 Install a hard drive in the hard drive carrier.
- 3 Press the release button on the front of the hard drive carrier and open the hard drive carrier handle.
- 4 Insert the hard drive carrier into the hard drive slot until the carrier connects with the backplane.
- 5 Close the hard drive carrier handle to lock the hard drive in place.

Cooling fans

Your system supports seven hot swappable cooling fans.

NOTE: In the event of a problem with a particular fan, the fan number is referenced by the system management software, allowing you to easily identify and replace the proper fan by noting the fan numbers on the cooling fan assembly.

Removing a cooling fan

WARNING: Opening or removing the system cover when the system is on may expose you to a risk of electric shock. Exercise utmost care while removing or installing cooling fans.

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

CAUTION: The cooling fans are hot-swappable. To maintain proper cooling while the system is on, replace only one fan at a time.

CAUTION: Do not operate the system with the cover removed for a duration exceeding 5 minutes.

Internal dual SD module (optional)

The Internal Dual SD Module (IDSDM) card provides two SD card slots. This card offers the following features:

- Dual card operation — maintains a mirrored configuration by using SD cards in both the slots and provides redundancy.

 **NOTE:** When the Redundancy option is set to Mirror Mode in the Integrated Devices screen of System Setup, the information is replicated from one SD card to another.

- Single card operation — single card operation is supported, but without redundancy.

Integrated storage controller card

Your system includes a dedicated expansion card slot on the system board for an integrated storage controller card. The integrated storage controller card provides the integrated storage subsystem for the internal hard drives in your system. The controller supports SAS and SATA hard drives and also enables you to set up the hard drives in RAID configurations. The RAID configurations depend on the version of the storage controller included with your system. The controller supports SAS hard drives.

Heat sink and processor

Use the following procedures when:

- Installing an additional processor.
- Replacing a processor.

NOTE: To ensure proper system cooling, install a processor blank in any empty processor socket.

Removing a processor

⚠ CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

- 1 Before upgrading your system, download the latest system BIOS version from support.dell.com and follow the instructions included in the compressed download file to install the update on your system.

ⓘ NOTE: You can update the system BIOS using the Lifecycle Controller.

- 2 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet. When disconnected from the power source, press and hold the power button for three seconds to fully drain the system of stored power prior to removing the cover.
- 3 Open the system.
- 4 Remove the cooling shroud.

⚠ WARNING: The heat sink and processor are too hot to touch for some time after the system has been powered down.
Allow the heat sink and processor to cool down before handling them.

⚠ CAUTION: Never remove the heat sink from a processor unless you intend to remove the processor. The heat sink is necessary to maintain proper thermal conditions.

- 5 Using a #2 Phillips screwdriver, loosen one of the heat-sink retention sockets. Wait 30 seconds for the heat sink to loosen from the processor.
- 6 Loosen the second heat-sink retention socket.
- 7 Lift the heat sink away from the processor and set the heat sink aside.

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

NOTE: If you are installing a single processor, it must be installed in socket CPU1.

- 1 Before upgrading your system, download the latest system BIOS version from support.dell.com and follow the instructions included in the compressed download file to install the update on your system.
- 2 **NOTE:** You can update the system BIOS using the Lifecycle Controller.
- 2 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet. When disconnected from the power source, press and hold the power button for three seconds to fully drain the system of stored power prior to removing the cover.
- 3 Open the system.
- 4 Remove the cooling shroud.

 **WARNING:** The heat sink and processor are too hot to touch for some time after the system has been powered down. Allow the heat sink and processor to cool down before handling them.

 **CAUTION:** Never remove the heat sink from a processor unless you intend to remove the processor. The heat sink is necessary to maintain proper thermal conditions.

- 5 Remove the heat sink/heat-sink blank and processor/processor blank, as applicable.

 **NOTE:** The procedure to remove the heat-sink blank or processor blank is similar to removing a heat-sink or processor.

- 6 Unpack the new processor.

- 7 Align the processor with the socket keys on the ZIF socket.

 **CAUTION:** Positioning the processor incorrectly can permanently damage the system board or the processor. Be careful not to bend the pins in the socket.

 **CAUTION:** Do not use force to seat the processor. When the processor is positioned correctly, it engages easily into the socket.

- 8 With the release levers on the processor socket in the open position, align pin 1 of the processor, using pin 1 position guide on the socket, as reference and set the processor lightly in the socket.

- 9 Close the processor shield.

- 10 Rotate the socket-release lever near the lock icon  until it is locked in position.

- 11 Similarly, rotate the socket-release lever near the unlock icon  until it is locked in position.

- 12 Using a clean lint-free cloth, remove the thermal grease from the heat sink.

 **CAUTION:** Applying too much thermal grease can result in excess grease coming in contact with and contaminating the processor socket.

- 13 Open the grease applicator included with your processor kit and apply all of the thermal grease in the applicator to the center of the topside of the new processor.

- 14 Place the heat sink on the processor.

- 15 Using a #2 Phillips screwdriver, tighten the heat-sink retention sockets.

- 16 Install the cooling shroud.

- 17 Close the system.

- 18 Reconnect your system and peripherals to their electrical outlets, and turn on the system.

- 19 Press <F2> to enter the System Setup and check that the processor information matches the new system configuration.

- 20 Run the system diagnostics to verify that the new processor operates correctly.

Power supplies

Your system supports either:

- Two 495 W, 750 W, or 1100 W AC power supply modules, or
- Two 750 W or 1100 W DC power supply modules

 **NOTE:** Titanium power supply is nominally rated for 200 VAC to 240 VAC input only.

When two identical power supplies are installed, the power supply configuration is redundant (1 + 1). In redundant mode, power is supplied to the system equally from both power supplies to maximize efficiency.

When only one power supply is installed, the power supply configuration is non-redundant (1 + 0). Power is supplied to the system only by the single power supply.

 **NOTE:** If two power supplies are used, they must be of the same type and have the same maximum output power.

 **CAUTION:** When installing 1100 W AC or DC PSU, you must install both the PSUs. Your system does not support only one 1100 W AC or DC PSU.

Hot Spare Feature

Your system supports the Hot Spare feature that significantly reduces the power overhead associated with power supply redundancy.

When the Hot Spare feature is enabled, a redundant power supply is switched to a sleep state. The active power supply supports 100% of the load, thus operating at higher efficiency. The redundant power supply in the sleep state monitors output voltage of the active power supply. If the output voltage of the active power supply drops, the redundant power supply in the sleep state returns to an active output state.

The active power supply can also activate a sleeping power supply if having both power supplies active is more efficient than having the redundant power supply in a sleep state. The power supply defaults are to wake both power supplies if the load on the active power supply is greater than 50% and to sleep the redundant power supply if the load falls below 20%.

You can configure the Hot Spare feature using the iDRAC settings. For more information on iDRAC settings, see the *iDRAC7 User's Guide* at dell.com/support/manuals.

Removing an AC power supply

CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

CAUTION: The system requires one power supply for normal operation. On power-redundant systems, remove and replace only one power supply at a time in a system that is powered on.

NOTE: You may have to unlatch and lift the optional cable management arm if it interferes with power supply removal. For information about the cable management arm, see the system's rack documentation.

- 1 Disconnect the power cable from the power source and the power supply you intend to remove and remove the cables from the strap.
- 2 Press the release latch and slide the power supply out of the chassis.

You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

1 Verify that both the power supplies are the same type and have the same maximum output power.

NOTE: The maximum output power (shown in Watts) is listed on the power supply label.

2 If applicable, remove the power supply blank.

3 Slide the new power supply into the chassis until the power supply is fully seated and the release latch snaps into place.

NOTE: If you unlatched the cable management arm, re-latch it. For information about the cable management arm, see the system's rack documentation.

4 Connect the power cable to the power supply and plug the cable into a power outlet.

CAUTION: When connecting the power cable, secure the cable with the strap.

NOTE: When installing, hot-swapping, or hot-adding a new power supply, allow several seconds for the system to recognize the power supply and determine its status. The power-supply status indicator turns green to signify that the power supply is functioning properly.

Wiring instructions for a DC power supply

Your system supports up to two -(48–60) V DC power supplies (when available).

WARNING: For equipment using -(48–60) V DC power supply units (PSUs), a qualified electrician must perform all connections to DC power and to safety grounds. Do not attempt connecting to DC power or installing grounds yourself. All electrical wiring must comply with applicable local or national codes and practices. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow all safety instructions that came with the product.

CAUTION: Wire the unit with copper only, unless otherwise specified, use only 10 American Wire Gauge (AWG) wire rated minimum 90 °C for source and return. Protect the -(48–60) V DC (1 wire) with a branch circuit over-current protection rated 50 A for DC with a high interrupt current rating.

CAUTION: Connect the equipment to a -(48–60) V DC supply source that is electrically isolated from the AC source (reliably grounded -(48–60) V DC SELV source). Ensure that the -(48–60) V DC source is efficiently secured to earth (ground).

NOTE: A readily accessible disconnect device that is suitably approved and rated shall be incorporated in the field wiring.

Troubleshooting system startup failure

If you boot the system to the BIOS boot mode after installing an operating system from the UEFI Boot Manager, the system stops responding. The vice-versa is also true. You must boot to the same boot mode in which you installed the operating system.

For all other startup issues, note the system messages that appear on the screen.

Troubleshooting external connections

Ensure that all external cables are securely attached to the external connectors on your system before troubleshooting any external devices.

Troubleshooting the video subsystem

- 1 Check the system and power connections to the monitor.
- 2 Check the video interface cabling from the system to the monitor.
- 3 Run the appropriate diagnostic test.

If the tests run successfully, the problem is not related to video hardware.

If the tests fail, see [Getting help](#).

Troubleshooting a USB device

Use the following steps to troubleshoot a USB keyboard/mouse. For other USB devices, go to step 7.

- 1 Disconnect the keyboard and mouse cables from the system briefly and reconnect them.
- 2 Connect the keyboard/mouse to the USB port(s) on the opposite side of the system.
- 3 If the problem is resolved, restart the system, enter the System Setup, and check if the non-functioning USB ports are enabled.
- 4 Replace the keyboard/mouse with another working keyboard/mouse.
- 5 If the problem is resolved, replace the faulty keyboard/mouse.
- 6 If the problem is not resolved, proceed to the next step to begin troubleshooting the other USB devices attached to the system.
- 7 Power down all attached USB devices and disconnect them from the system.
- 8 Reboot the system and, if your keyboard is functioning, enter the System Setup. Verify that all USB ports are enabled on the **Integrated Devices** screen, in the System Setup options.
If your keyboard is not functioning, you can also use remote access. If the system is not accessible, reset the NVRAM_CLR jumper inside your system and restore the BIOS to the default settings.
- 9 Reconnect and power on each USB device one at a time.
- 10 If a device causes the same problem, power down the device, replace the USB cable with a known good cable, and power up the device.

If all troubleshooting fails, see [Getting help](#).

Troubleshooting a serial I/O device

- 1 Turn off the system and any peripheral devices connected to the serial port.
- 2 Swap the serial interface cable with a working cable, and turn on the system and the serial device.
If the problem is resolved, replace the interface cable with a known good cable.
- 3 Turn off the system and the serial device, and swap the device with a comparable device.
- 4 Turn on the system and the serial device.

If the problem persists, see [Getting help](#).

Troubleshooting a NIC

- 1 Run the appropriate diagnostic test. See [Using System Diagnostics](#) for available diagnostic tests.
- 2 Reboot the system and check for any system messages pertaining to the NIC controller.

- 3 Check the appropriate indicator on the NIC connector:
 - If the link indicator does not glow, check all cable connections.
 - If the activity indicator does not glow, the network driver files might be damaged or missing. Remove and reinstall the drivers if applicable. See the NIC's documentation.
 - If applicable, change the autonegotiation setting.
 - Use another connector on the switch or hub.
- 4 Ensure that the appropriate drivers are installed and the protocols are bound. See the NIC's documentation.
- 5 Enter the System Setup and confirm that the NIC ports are enabled on the **Integrated Devices** screen.
- 6 Ensure that the NICs, hubs, and switches on the network are all set to the same data transmission speed and duplex. See the documentation for each network device.
- 7 Ensure that all network cables are of the proper type and do not exceed the maximum length.

If all troubleshooting fails, see [Getting Help](#).

Troubleshooting a wet system

- 2 Turn off the system and disconnect it from the electrical outlet for at least one hour.
- 3 Reconnect the system to the electrical outlet and turn on the system.
- 4 Enter the System Setup.

If the date and time are not correct in the System Setup, check the SEL for system battery messages.

If the problem persists, see [Getting help](#).

① NOTE: Some software may cause the system time to speed up or slow down. If the system seems to operate normally except for the time kept in the System Setup, the problem may be caused by software rather than by a defective battery.

Troubleshooting power supplies

△ CAUTION: Many repairs may only be done by a certified service technician. You should only perform troubleshooting and simple repairs as authorized in your product documentation, or as directed by the online or telephone service and support team. Damage due to servicing that is not authorized by Dell is not covered by your warranty. Read and follow the safety instructions that are shipped with your product.

Using system diagnostics

If you experience a problem with your system, run the system diagnostics before contacting Dell for technical assistance. The purpose of running system diagnostics is to test your system hardware without using additional equipment or risking data loss. If you are unable to fix the problem yourself, service and support personnel can use the diagnostics results to help you solve the problem.

i | NOTE: For more information about OEM diagnostic event messages, see the **Event and Error Message Reference Guide for 13th Generation Dell PowerEdge Servers Version 1.2**

Dell Online Diagnostics

Dell Online Diagnostics, a stand-alone suite of diagnostic programs or test modules, allows you to run diagnostic tests on the systems in a production environment, and helps you ensure maximum uptime of your systems. Online Diagnostics allows you to run diagnostic tests on chassis and storage components such as hard drives, physical memory, and network interface cards (NICs). You can use the graphical user interface (GUI) or the command line interface (CLI) to run diagnostic tests on the hardware that Online Diagnostics discovers on your system. For information about using diagnostics, see the *Dell Online PowerEdge Diagnostics User's Guide* under **Software > Serviceability Tools**, at dell.com/support/manuals.

Dell Embedded System Diagnostics

i | NOTE: The Dell Embedded System Diagnostics is also known as Enhanced Pre-boot System Assessment (ePSA) diagnostics.

The Embedded System Diagnostics provides a set of options for particular device groups or devices allowing you to:

- Run tests automatically or in an interactive mode
- Repeat tests
- Display or save test results
- Run thorough tests to introduce additional test options to provide extra information about the failed device(s)
- View status messages that inform you if tests are completed successfully
- View error messages that inform you of problems encountered during testing

When to use the Embedded System Diagnostics

Run the Embedded System Diagnostics (ePSA) if your system does not boot.

Running the Embedded System Diagnostics

Run the Embedded System Diagnostics (ePSA) if your system does not boot. The embedded system diagnostics program is run from the Dell Lifecycle Controller.

If a major component or device in the system does not operate properly, running the embedded system diagnostics may indicate component failure.

 **CAUTION:** Use the embedded system diagnostics to test only your system. Using this program with other systems may cause invalid results or error messages.

- 1 As the system boots, press F11.
- 2 Use the up and down arrow keys to select **System Utilities > Launch Dell Diagnostics**.

The **ePSA Pre-boot System Assessment** window is displayed, listing all devices detected in the system. The diagnostics starts running the tests on all the detected devices.

System diagnostics controls

Menu	Description
Configuration	Displays the configuration and status of all detected devices.
Results	Displays the results of all tests that are executed.
System health	Provides the current overview of the system performance.

Disabling forgotten password

The software security features of the system include a system password and a setup password. The password jumper enables or disables password features and clears any password(s) currently in use.

- 1 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 2 Remove the system cover.
- 3 Move the jumper on the system board jumper from pins 4 and 6 to pins 2 and 4.
- 4 Install the system cover.

The existing passwords are not disabled (erased) until the system boots with the jumper on pins 2 and 4. However, before you assign a new system and/or setup password, you must move the jumper back to pins 4 and 6.

(i) NOTE: If you assign a new system and/or setup password with the jumper on pins 2 and 4, the system disables the new password(s) the next time it boots.

- 5 Reconnect the system to its electrical outlet and turn on the system, including any attached peripherals.
- 6 Turn off the system, including any attached peripherals, and disconnect the system from the electrical outlet.
- 7 Remove the system cover.
- 8 Move the jumper on the system board jumper from pins 2 and 4 to pins 4 and 6.
- 9 Install the system cover.
- 10 Reconnect the system to its electrical outlet and turn on the system, including any attached peripherals.
- 11 Assign a new system and/or setup password.

Particulate Contamination

① | NOTE: This section defines the limits to help avoid IT equipment damage and/or failure from particulates and gaseous contamination. If it is determined that levels of particulates or gaseous pollution are beyond the limits specified below and are the reason for the damage and/or failures to your equipment, it may be necessary for you to re-mediate the environmental conditions that are causing the damage and/or failures. Re-mediation of environmental conditions will be the responsibility of the customer.

Air Filtration

Data center air filtration as defined by ISO Class 8 per ISO 14644-1 with a 95% upper confidence limit.

Environmental

(i) NOTE: Applies to data center environments only. Air filtration requirements do not apply to IT equipment designed to be used outside a data center, in environments such as an office or factory floor.

Conductive Dust

(i) NOTE: Applies to data center and non-data center environments.

Corrosive Dust

(i) NOTE: Applies to data center and non-data center environments.

(i) NOTE: Air entering the data center must have MERV11 or MERV13 filtration.

Air must be free of conductive dust, zinc whiskers, or other conductive particles.

- Air must be free of corrosive dust.

- Residual dust present in the air must have a deliquescent point less than 60% relative humidity.

Gaseous Contamination

(i) NOTE: Maximum corrosive contaminant levels measured at ≤50% relative humidity.

System messages

- [LCD Messages](#)
- [System Error Messages](#)
- [Warning messages](#)
- [Diagnostic messages](#)
- [Alert messages](#)

LCD Messages

(i) | NOTE: Applicable only if your system has an LCD display.

The LCD messages consist of brief text messages that refer to events recorded in the System Event Log (SEL). For information on the SEL and configuring system management settings, see the systems management software documentation.

(i) | NOTE: If your system fails to boot, press the System ID button for at least 5 seconds until an error code is displayed on the LCD. Record the code, then see [System Error Messages](#).

Viewing LCD messages

If a system error occurs, the LCD screen will turn amber. Press the Select button to view the list of errors or status messages. Use the Left and Right buttons to highlight an error number, and press the Select button to view the error.

Removing LCD Messages

For faults associated with sensors, such as temperature, voltage, fans, and so on, the LCD message is automatically removed when that sensor returns to a normal state. For other faults, you must take action to remove the message from the display:

- Clear the SEL — You can perform this task remotely, but you will lose the event history for the system.
- Power cycle — Turn off the system and disconnect it from the electrical outlet; wait approximately 10 seconds, reconnect the power cable, and restart the system.

System Error Messages

System messages appear on the monitor to notify you of a possible problem with the system. These messages refer to events recorded in the System Event Log (SEL). For information on the SEL and configuring system management settings, see the systems management software documentation.

Some messages are also displayed in an abbreviated form on the system's LCD, if the system includes that feature.

(i) | NOTE: The LCD error messages listed here are displayed in the simple format. See [Setup Menu](#) to select the format in which the messages are displayed.

- (i) NOTE:** If you receive a system message not listed here, check the documentation of the application that was running when the message was displayed or the operating system's documentation for an explanation of the message and recommended action.
- (i) NOTE:** In some messages, a particular system component is identified by name ("<name>") component number ("<number>"), or location ("bay").

Warning messages

A warning message alerts you to a possible problem and prompts you to respond before the system continues a task. For example, before you format a hard drive, a message warns you that you may lose all data on the hard drive. Warning messages usually interrupt the task and require you to respond by typing y (yes) or n (no).

 **NOTE:** Warning messages are generated by either the application or the operating system. For more information, see the documentation that shipped with the operating system or application.

Diagnostic messages

The system diagnostic utility generates messages if there are errors detected when you run diagnostic tests on your system. For more information about system diagnostics, see the For information about the event and error messages generated by the system firmware and agents that monitor system components, see the Error Code Lookup page, at qrl.dell.com.

Alert messages

Systems management software generates alert messages for your system. Alert messages include information, status, warning, and failure messages for drive, temperature, fan, and power conditions. For more information, see the systems management software documentation.
